

Endpoint	Backend responsibility	Frontend (what users see)	Where it lives (repo)
<code>GET /v1/meta/enums</code>	Return canonical lists for dropdowns (platforms, intents, CTAs, audience temperature, device, customer type, product types, regions/age bands, ...).	All select fields populated from API (single source of truth).	BE: AdVise/api/routes/meta.py (new); FE: AdVise/app/ui_components.py or helpers imported by pages/2_Campaign_Input.py.
<code>GET /v1/status</code>	Liveness + optional: model_version, max_creatives, upload limits; if using Prefect: worker/queue reachable flag.	Optional “Backend connected” badge; failures → friendly error before upload.	BE: AdVise/api/routes/route2.py (or dedicated health.py); FE: light check in app.py / pages/2_Campaign_Input.py.
<code>POST /v1/predictions/preview</code>	Validate payload + files → creative feature extraction → intent-specific model output → rule-based hints → ranking + recommendation blocks. Persist temp files/object keys if needed. 200 — API triggers Prefect flow and waits until extraction (+ scoring) finishes; response body = full results immediately.	pages/2_Campaign_Input: multi-step form + file upload + “Analyze”. pages/3_Prediction_Results: cards per creative, primary KPI, rank #1–#3, tips.	BE: AdVise/api/routes/predictions_preview.py (new) + scoring helpers; FE: AdVise/app/pages/2_Campaign_Input.py, AdVise/app/pages/3_Prediction_Results.py.

GET /v1/prediction-runs/{run_id}	Return queued running success failed + final results object when successful.	After submit: “Processing...” with polling until success → same results screen as preview.	BE: router next to preview + small store (DB/redis) or read via Prefect; FE: pages/3_Prediction_Results.py (poll loop / st.status).
<i>(optional P1)</i> POST/GET/PUT/DELETE /v1/campaigns	Persist campaign configuration (scalar fields); DB-backed CRUD.	“Saved campaigns” list, edit, re-run prediction.	BE: <code>AdVise/api/routes/campaigns.py</code> + SQLAlchemy models/schemas; FE: new page e.g. <code>pages/4_Saved_Campaigns.py</code> .
<i>(optional P1)</i> POST /v1/campaigns/{id}/predictions	Same inference as preview, input from saved campaign (+ stored creatives); returns prediction run record.	“Run again” / history timestamps on results.	BE: <code>campaigns</code> + <code>predictions</code> modules; FE: results page + navigation from saved campaign.
